

Assignment – 7

1. Write a JavaScript program which will print 'HelloWorld' in the body of the HTML document

```
<!DOCTYPE html>
<html>
<body>
  <script>
    document.body.innerHTML = 'HelloWorld';
  </script>
</body>
</html>
```

2. Write a JavaScript function that reverses a number.

Example x = 32243;

Expected Output : 34223

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <title>ReverseNumber</title>
</head>
<body>
  <h2>Reverse a Number</h2>

  <p>Original number: <span id="original"></span></p>
  <p>Reversed number: <span id="reversed"></span></p>

  <script>
    function reverseNumber(x) {
      return parseInt(x.toString().split('').reverse().join(''));
    }
    let x = 32243;
    document.getElementById("original").textContent = x;
    document.getElementById("reversed").textContent = reverseNumber(x);
  </script>
</body>
</html>
```

3. Write a JavaScript function that checks whether a passed string is palindrome or not?

```
<!DOCTYPE html>
<html>
<body>
  <script>
    const isPalindrome = str => str === str.split('').reverse().join('');
    const word = prompt("Enter a word to check if it's a palindrome:");
    document.body.innerHTML = `${word} is palindrome? ${isPalindrome(word)}`;
  </script>
</body>
</html>
```

4. Write a JavaScript function that accepts a string as a parameter and converts the first letter of each word of the string in upper case.

```
<!DOCTYPE html>
<html>
<body>
  <script>
    const capitalizeWords = str =>
      str.split(' ')
        .map(word => word.charAt(0).toUpperCase() + word.slice(1))
        .join(' ');

    const text = 'hello world from javascript';
    document.body.innerHTML = capitalizeWords(text);
  </script>
</body>
</html>
```

5. Write a JavaScript program that displays the position of the first occurrence of "World" in the variable txt.

```
<!DOCTYPE html>
<html>
<body>
  <script>
    const txt = 'Hello World, welcome to the World!';
    const position = txt.indexOf('World');
    document.body.innerHTML = `First occurrence of "World" is at position:
    ${position}`;
  </script>
</body>
</html>
```

6. Write a JavaScript program that converts the text to upper case.

```
<!DOCTYPE html>
<html>
<body>
  <script>
    const txt = 'hello world';
    document.body.innerHTML = txt.toUpperCase();
  </script>
</body>
</html>
```

7. Write a JavaScript function to remove specified number of characters from a string.

```
<!DOCTYPE html>
<html>
<body>
  <script>
    const removeChars = (str, count) => str.substring(count);
    const result = removeChars('HelloWorld', 5);
    document.body.innerHTML = result; // Output: World
  </script>
</body>
</html>
```

8. Create an HTML page with two textboxes and a Calculate button:
When user enters the numbers and clicks the Calculate button, it has to alert the sum.

```
<!DOCTYPE html>
<html>
<body>
  <h3>Sum Calculator</h3>
  <input type="number" id="num1" placeholder="Enter first number">
  <input type="number" id="num2" placeholder="Enter second number">
  <button id="calcBtn">Calculate</button>

  <script>
    const calcBtn = document.getElementById('calcBtn');
    calcBtn.addEventListener('click', () => {
      const n1 = parseFloat(document.getElementById('num1').value);
      const n2 = parseFloat(document.getElementById('num2').value);
      alert(`Sum = ${n1 + n2}`);
    });
  </script>
</body>
</html>
```

9. Write a JavaScript program which will have one textbox to get input as string and after giving input when you leave the input textbox, a function is triggered which transforms the input text to uppercase.

```
<!DOCTYPE html>
<html>
<body>
  <h3>Convert to Uppercase</h3>
  <input type="text" id="inputBox" placeholder="Type something">

  <script>
    const inputBox = document.getElementById('inputBox');
    inputBox.addEventListener('blur', () => {
      inputBox.value = inputBox.value.toUpperCase();
    });
  </script>
</body>
</html>
```
